## WORKSHEETS FOR PUPILS

| Name of activity | $\begin{gathered} \text { Estimated } \\ \text { time } \\ \text { needed } \end{gathered}$ | Difficulty of activity | Age of children for whom the activity is suitable | Tools and used materials | Objective of activity |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Comet | $\begin{aligned} & 20-30 \\ & \text { minutes } \end{aligned}$ | medium | 14-15 | encyclopaedia, atlas or internet, calculator, spreadsheet | concept of comet, tail, movement around the sun |
| Minor Planet Velocity | $\begin{aligned} & 30-40 \\ & \text { minutes } \end{aligned}$ | very hard | 14-15 | encyclopaedia, atlas or internet, calculator, spreadsheet | 3. Kepler's law, unit conversions |
| Energy | $\begin{aligned} & 20-30 \\ & \text { minutes } \end{aligned}$ | medium | 14-15 | paper, computer, calculator | law of conservation of mechanical energy, kinetic and positional energy |
| Impact <br> Craters | $\begin{aligned} & 20-30 \\ & \text { minutes } \end{aligned}$ | medium | 14-15 | metre ruler, calculator, spreadsheet, graph paper | work with map, kinetic energy, volume, weight, density |
| Gravitational <br> Force | $\begin{aligned} & 20-30 \\ & \text { minutes } \end{aligned}$ | medium | 14-15 | calculator, spreadsheet, graph paper | gravitational force, sphere volume, unit conversions |

## Worksheet 3: ENERGY

Practical Exercise: The ten-kilogram weight is at rest at a height of 10 km above the Earth's surface. Calculate the positional energy according to the equation $E_{p}=m h g$, where $g=10 \mathrm{~N} \cdot \mathrm{~kg}^{-1}$, $h=5 \mathrm{~km}$. How much energy is converted from positional energy to kinetic energy if the body is moved from 10 km to 5 km ? Estimate what maximum speed the weight can reach if we do not take air resistance into account.

Practical Exercise: Let's look at the energy that is released when a moving object suddenly stops - e.g. a comet or minor planet hits the Earth. The usual velocities of minor planets hitting the Earth range from $20 \mathrm{~km} \cdot \mathrm{~s}-1$ to $70 \mathrm{~km} \cdot \mathrm{~s}^{-1}$.
Imagine a kilogram object that hits the Earth at speed $20 \mathrm{~km} \cdot \mathrm{~s}^{-1}$. Calculate how much energy is released during this collision.

Practical Exercise: Now, imagine the same object, only hitting the Earth at a speed of $70 \mathrm{~km} \cdot \mathrm{~s}^{-1}$. Calculate how much energy is released during this collision. Compare with the previous value.

Practical Exercise: We will look at the effect of the size of the incident object on the released energy. Calculate the released energy of a two-kilogram object that collides with the Earth at speed $20 \mathrm{~km} \cdot \mathrm{~s}^{-1}$. Compare with the answer in the first case.
